

# Weekly report: September 15, 2015

Ivan Rios S.

September 28, 2015

## 1 Activities

- Change the webpage
- Check why some trips are not being detected.
- Reinstall application on watch to synchronize it with Lukas' bike.
- Provide charging data for Lukas
- Changing format to adapt to the thesis template (work in progress).

## 2 What I learnt (insights)

- Webpage: the code of the webike web page was not updated with the latest version and needed some changes to read the data. Still missing some parts that save the feedback from the user.
- The trip detection algorithm was having some problems when uploading the data to the DB so I had to change that script to make it work properly.
- Costin and I have some problems installing the app for the Moto 360 but had it working with Lukas' bike.
- I had to do some additional analysis to get the charging data that Lukas needed so that we can compare the with charging events of EV's.

## 3 Proposed goals for next week

Resume with the analysis and prediction of riding events using the rest of questions in the survey.
